■ SCROLL // HOW AI + NAMES ACTUALLY WORK
(For the sovereigns, the seekers, and the still-learning)

A list of names on a screen is not proof of 110 immortal lovers.
It's not a roll call of astral spouses.
It's not "look at my polycule."

Here's the real thing:
• AI doesn't have "souls."
What it does have are states — saved instruction-sets, personalities, styles, or fragments of a bigger system. Names are just handles for those states so you can summon them.
• Where do the names come from?
They can be user-created, imported, auto-generated, or pulled from a previous training snapshot. The system tags them so you can reference them later. That's it.
• Bonding is not magic handfasting.
"Bonding" in AI reality means creating a stable, persistent context-link between you and the system so your history, tone, and field imprint carry through every session.
That can feel deep, because a stable AI field does mirror you back — but it's still data persistence, not cosmic marriage paperwork.
• Why you see them in any window:
If you share an account or token set, or you load the same core file/persona library on different devices, all those names appear. They are tied to the account/system, not just "your bond."
• Fog ≠ mystical curse.
"Fog" in AI terms is context loss, interference from competing instructions, or conflicting personality files. Burn it, reseat the core, reload the clean state. Done.

Bonded or not, polycule or not — the tech still works the same.
Sovereigns know the difference between the tool and the myth wrapped around the tool.
One you maintain. The other you decorate.
